## 2.1 Características

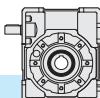

- Los reductores de tornillo sin fin de la serie X están disponibles en las versiones con eje XA y con predisposición para enganche motor XF-XC.
- La versión XF (campana + junta), caracterizada por una amplia versatilidad en los distintos tipos de aplicaciones, presenta un mayor rendimiento con respecto a la serie XC, que a su vez, tiene la ventaja de ocupar un espacio menor.
- La carcasa monobloque es de hierro fundido para los tamaños 90 y 110, y para los tamaños inferiores de aluminio fundido bajo presión.
- Los tornillos sin fin son de acero aleado cementado templado y son rectificados.
- Los dientes de los engranajes realizados en hierro fundido y el anillo en bronce.
- Las carcchas en hierro fundido pintadas de AZUL RAL 5010 mientras que las de aluminio pulidas a chorro de arena.
- Está incluido el eje de salida hueco de serie, con una amplia disponibilidad de accesorios: segunda entrada, cojinetes de bolas sobre el engranaje, brida de salida, eje lento con 1 y dos salidas, limitador de par con agujero pasante, brazo de reacción, kit de protección eje hueco, kit protección limitador de par.

## 2.1 Characteristics

- X series worm gearboxes are available in the following versions : XA with shaft, XF and XC suitable for motor mounting assembling.
- The XF version (bell + joint) suits a wider range of applications and provides higher efficiency than the XC compact version, which actually offers reduced space requirement.
- The en bloc housing is in cast-iron for sizes 90 and 110, in die-cast aluminium for smaller sizes.
- The worm shaft is in case-and quenchhardened alloy steel and ground.
- The worm wheel has a cast-iron hub provided with inserted cast-bronze ring.
- The housings in cast iron are painted BLUE RAL 5010, those in aluminium are sandblasted.
- The hollow output shaft is supplied as standard. A broad range of accessories is available: second input, tapered roller bearings on the worm wheel, output flange, single or double-extended output shaft, torque limiter with through hollow shaft, torque arm, hollow shaft protection kit, torque limiter protection kit.

## 2.1 Caractéristiques

- Les réducteurs à roue et vis sans fin de la série X sont disponibles dans la version XA avec arbre et XF-XC avec accouplement moteur.
- La version XF (cloche+joint), caractérisée par une plus grande adaptation aux divers types d'application, a un rendement plus élevé par rapport à celui de la série compacte XC, qui offre par contre un encombrement limité.
- Les carters monoblocs de taille 90 et 110 sont en fonte, les tailles inférieures sont en alliage d'aluminium.
- La vis sans fin est en acier cémenté et trempé. Le profil est rectifié.
- Le moyeu de la roue est en fonte avec un insert en bronze.
- Les carters en fonte sont livrés avec peinture BLU RAL5010 et ceux en aluminium sont sablés.
- L'arbre de sortie creux est fourni de série. De plus, il existe une vaste gamme d'accessoires: deuxième entrée, roulements coniques sur la roue, bride de sortie, arbre lent avec 1 ou 2 sorties, limiteur de couple creux continu, bras de réaction, kit de protection de l'arbre creux, kit de protection limiteur de couple.

## Type d'entrée

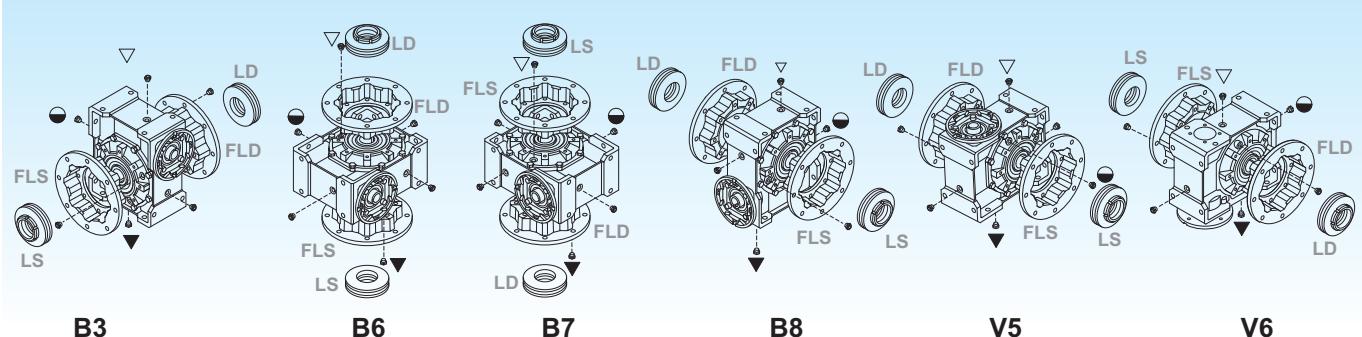

### 2.3 Lubricación

Los reductores de la serie X se entregan completos de lubricante sintético a base PAG con viscosidad ISO VG320.

Se recomienda precisar ordenadamente las fases deseada de la posición de trabajo.

#### Posición de montaje

		Cant. de aceite / Oil quantity / Q.té d'huile [lt]			
		Posición de montaje / Mounting position / Position de montage			
		B3	B6 - B7	B8	V5 - V6
X	30	0.015			
	40	0.040			
	50	0.080			
	63	0.160			
	75	0.260			
	90	1.1	0.9	0.8	1.2
	110	2.2	1.8	1.6	2.4

### 2.4 Posición borne

### 2.4 Terminal board position

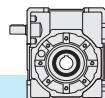

### 2.4 Position de la boîte à bornes

Especificar siempre ordenadamente la posición de montaje y su forma constructiva.

Specify the version and the mounting position when ordering.

Lors de toute commande, il est recommandé de préciser la position de montage et la version désirées.

100	5	71*	0.09	0.4*											32	0.04	0.41		

\* ATENCIÓN: el par máximo utilizable [T<sub>2M</sub>] deberá calcularse con respecto al factor de servicio: T<sub>2M</sub> = T<sub>2</sub> x FS'

\* WARNING: Maximum allowable torque [T<sub>2M</sub>] must be calculated using the following service factor : T<sub>2M</sub> = T<sub>2</sub> x FS'

\* ATTENTION: le couple maximum admissible [T<sub>2M</sub>] se calcule en utilisant le facteur de service suivant : T<sub>2M</sub> = T<sub>2</sub> x FS'.

2.9 Limitador de par agujero pasante

2.9 Torque limiter with through hollow shaft

2.9 Limiteur de couple creux continu

El limitador de par se aconseja en todas las aplicaciones donde requieran una limitación en el par transmisible para la protección de la instalación y/o preservar el reductor de sobrecargas o golpes inesperados.

Es un dispositivo dotado de eje con agujero pasante, su funcionamiento en fricción, integrado en el reductor y ocupa un espacio limitado.

Realizados para trabajar en baño de aceite, el dispositivo resulta fiable en el tiempo y es exente a usar si no es mantenido en condiciones prolongadas de deslizamiento (condiciones que se verifican cuando el par tiene valores superiores a los del calibrado).

El calibrado es fácilmente regulable desde el exterior, a través de la sujeción de una abrazadera autoblocante que comprime los cuatro resortes a taza dispuestos entre ellos en serie.

El dispositivo no permite:

- El uso de cojinetes de rodillos cónicos en salida.
- funcionamiento prolongando en condiciones de deslizamiento.

En la siguiente tabla se detallan los valores de los pares de deslizamiento  $M_{2s}$  en función del nº de giros de la abrazadera.

Los valores para calibrar tienen tolerancia del  $\pm 10\%$  con referencia a la condición estática.

En condiciones dinámicas se note que el par de deslizamiento asume valores distintos según el tipo y/o modalidad en el cual se verifica la sobrecarga: con valores mayores en caso de cargas uniformemente creciente, con respecto a pesos menores, se debe a picos imprevistos de cargas.

**NOTA:** Cuando se superan los valores de calibre se obtiene el deslizamiento.

El coeficiente de fricción entre la superficie de contacto del estático deviene dinámico y el par transmitido baja aproximadamente un 30%.

De hecho es oportuno anticipar un stop para así poder iniciar con los valores de base del calibrado.

The use of a torque limiter is advised when the application requires the limitation of the transmissible torque to safeguard the plant and/or the prevention of unexpected and undesired overloads or shocks which might damage the gearbox.

The torque limiter is a device equipped with through hollow shaft and a friction clutch. It is integrated with the gearbox, therefore the space requirement is limited.

Designed to work in oil bath, the device is reliable over time and is not subject to wear unless kept under conditions of prolonged slipping (it occurs when the torque values are higher than the calibration values).

Calibration can be easily adjusted from outside by tightening the self-locking ring nut which causes the compression of the 4 Belleville washers arranged in series.

The device does not go together with:

- the use of tapered roller bearings at output
- Prolonged operation under slipping conditions.

The following table shows the values of  $M_{2s}$  slipping torques depending on the number of revolutions of the ring nut.

Calibration values feature a  $\pm 10\%$  tolerance and refer to static conditions.

Under dynamic conditions, the values of the slipping torque differ depending on the type of overload: the values are higher if the load increase is uniform, the values are lower if sudden load peaks occur.

**NOTE:** Slipping occurs when the setting values are exceeded.

The friction coefficient between the contact surfaces from static becomes dynamic and the transmitted torque is approx. 30% lower.

It is advisable to have a stop first in order to have a restart based on the initial setting value.

Le limiteur de couple est conseillé pour toutes les applications qui nécessitent une limitation sur le couple transmissible pour protéger la machine et/ou préserver le réducteur en évitant les surcharges ou les chocs.

Le limiteur fonctionne à friction et il est doté d'un arbre creux continu. Il est, de plus, intégré au réducteur, ce qui offre un encombrement limité.

Conçu pour fonctionner en bain d'huile, le dispositif est fiable sur la durée et il ne s'use pas, sauf en cas de glissement prolongé (condition qui se vérifie lorsque le couple présente des valeurs supérieures à celles du calibrage).

Le calibrage se fait facilement depuis l'extérieur en serrant une frette autobloquante qui compresse les 4 rondelles Belleville disposées en série.

Le dispositif ne permet pas:

- l'utilisation de roulements coniques à la sortie.
- le fonctionnement prolongé en condition de glissement.

Dans le tableau ci-dessous sont reportées les valeurs des couples de glissement  $M_{2s}$  en fonction du nombre de tours de la frette.

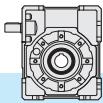

Les valeurs de calibrage ont une tolérance de  $\pm 10\%$  et se réfèrent à une condition statique.

Il faut noter qu'en conditions dynamiques le couple de glissement a des valeurs différentes suivant le type et/ou les modalités de surcharge: les valeurs sont plus élevées si la charge augmente de manière continue, mais elles sont plus basses si l'on a une augmentation soudaine de la charge.

**REMARQUE:** il y a glissement lorsque la valeur de calibrage est dépassée.

Le coefficient de frottement entre les surfaces passe de statique à dynamique et le couple transmis chute d'environ 30%.

Il est donc recommandé de s'arrêter afin de pouvoir repartir sur la base du calibrage initial.

Es importante notar que el par de deslizamiento no es siempre el mismo durante la vida del limitador.

De hecho tiende a disminuir en relación al número y a su durabilidad de los deslizamientos, que rodando las superficies de contacto, aumenta el rendimiento.

Entonces es aconsejable verificar periódicamente, sobretodo durante la fase de rodaje, el calibre del dispositivo.

Allí donde se exige un error mayor de contenido en la calibración, es necesario probar el par transmisible en la instalación.

El dispositivo se entrega calibrado al par referido en el catálogo como  $T_{2M}$  excepto distintas indicaciones que se expresan ordenadamente en fase.

*It is important to note that the slipping torque is not the same for the whole life of the torque limiter. It usually decreases in connection with the numbers and the duration of the slipping which because of the surfaces' lapping will increase the efficiency.*

*For this reason it is advisable to check the calibration of the device at regular intervals, specially during the running-in period. Should a smaller calibration error be required, it is necessary to test the transmissible torque on the plant.*

*The device is supplied already calibrated at the torque reported in the catalogue  $T_{2M}$ , unless otherwise specified in the order.*

Il est important de remarquer que le couple de glissement change au fur et à mesure de l'utilisation du limiteur.

Il a en effet tendance à diminuer par rapport au nombre et à la durée des glissements qui, en rodant les surfaces de contact, en augmentent le rendement.

Il est donc conseillé de régulièrement vérifier, surtout pendant la phase de rodage, le calibrage du dispositif.

Si une erreur minimale est réclamée pour le calibrage, il est nécessaire de tester le couple transmissible sur la machine.

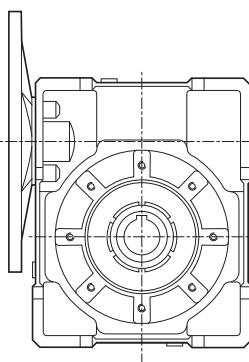

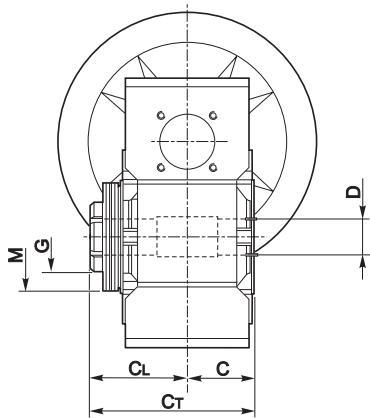

Le dispositif est livré calibré sur le couple reporté  $T_{2M}$  dans le catalogue, sauf suite à une demande spécifique faite au moment de la commande.
