### 2.1 Caratteristiche

I riduttori della serie a vite senza fine SFK - SRK si presentano estremamente leggeri grazie alla forma compatta e la carcassa realizzata in alluminio pressofuso. La serie presenta una svariata possibilità di versioni, con e senza piedi e con numerosi accessori che la rendono più versatile nell'impiego delle più svariate tipologie di applicazioni. La vite senza fine è in acciaio legato cementato-temprato ed è rettificata. La corona ha mozzo in ghisa con riporto di fusione in bronzo.

### 2.1 Characteristics

The SFK - SRK worm gearboxes are extremely light thanks to the compact shape of the housing made of cast aluminium. This series features a wide range of versions, with and without feet, with numerous accessories which make it extremely versatile for utilization in various applications. The worm shaft is ground and is made of hardened-casehardened compound steel. The worm wheel features a cast iron hub with bronze casting.

### 2.1 Merkmale

Die Schneckengetriebe der SFK - SRK Serie sind äußerst leicht dank der kompakten Form des Gehäuses aus Aluminiumguss. Die Serie bietet verschiedene Versionen mit und ohne Füße sowie zahlreiche Zubehörteile an, was zur vielseitigen Anwendbarkeit der Getriebe in vielerlei Applikationen dient. Die Schneckenwelle ist aus legierten gehärteten Einsatzstahl und ist geschliffen. Der Zahnkranz verfügt über eine Nabe aus Gusseisen mit Schmelzeinsatz aus Bronze.

Specify the version when ordering.

Bei der Bestellung immer die Bauform angeben.

### 2.3 Lubrificazione

Riduttori a vite senza fine SFK - SRK sono forniti tutti e sempre completi di lubrificante sintetico a base PAG con classe di viscosità ISO 320. Nei corpi in alluminio 30, 40, 50, 63, 75 è presente un solo tappo di riempimento olio.

Quantità di lubrificante (litri)

### 2.3 Lubrication

SFK - SRK worm gearboxes are supplied with PAG synthetic lubricant featuring an ISO 320 viscosity class. Aluminium housings size 30, 40, 50, 63 and 75 have one filling plug only.

Lubricant quantity (liters)

SFK SRK	B3	B6-B7	B8	V5-V6
30		0.015		
40		0.040		
50		0.080		
63		0.160		
75		0.260		

### 2.3 Schmierung

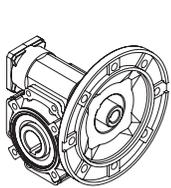

SFK - SRK Schneckengetriebe werden mit PAG synthetischen Schmierstoff Viskositätsklasse ISO 320 geliefert. Gehäuse aus Aluminium Größe 30, 40, 50, 63 und 75 verfügen nur über eine Einfüllschraube.

### 2.10 Limitatore di coppia cavo passante

Il limitatore di coppia viene consigliato in tutte quelle applicazioni che richiedono una limitazione sulla coppia trasmissibile per proteggere l'impianto e/o preservare il riduttore evitando sovraccarichi o urti indesiderati quanto inaspettati.

È un dispositivo con albero dotato di cavo passante, con funzionamento a frizione, ed è integrato al riduttore, presentando un ingombro limitato.

Concepito per lavorare a bagno d'olio, il dispositivo risulta affidabile nel tempo ed è esente da usura se non viene mantenuto in condizioni prolungate di slittamento (condizione che si verifica quando la coppia presenta valori superiori a quelli di taratura).

La taratura è facilmente regolabile dall'esterno attraverso il serraggio di una ghiera autobloccante che porta a compressione le 4 molle a tazza disposte tra loro in serie.

Il dispositivo non consente:

- l'impiego di cuscinetti a rulli conici in uscita
- funzionamento prolungato in condizioni di slittamento.

Nella tabella seguente vengono riportati i valori delle coppie di slittamento  $M_{2S}$  in funzione del n° di giri della ghiera.

I valori di taratura presentano una tolleranza del  $\pm 10\%$  e si riferiscono ad una condizione statica.

In condizioni dinamiche è da notare che la coppia di slittamento assume valori diversi a seconda del tipo e/o modalità in cui si verifica il sovraccarico: con valori maggiori in caso di carico uniformemente crescente rispetto a valori più contenuti in seguito al verificarsi di picchi improvvisi di carico.

**NOTA:** quando si supera il valore di taratura si ha slittamento. Il coefficiente di attrito tra le superfici di contatto da statico diventa dinamico e la coppia trasmessa cala del 30% circa.

E' quindi opportuno prevedere uno stop per poter ripartire al valore di taratura iniziale.

E' importante notare che la coppia di slittamento non resta sempre la medesima durante tutta la vita del limitatore.

Tende infatti a diminuire in rapporto al numero e alla durata degli slittamenti che, rodando le superfici di contatto, ne aumentano il rendimento.

È quindi opportuno verificare periodicamente, soprattutto durante la fase di rodaggio, la taratura del dispositivo.

Là dove sia richiesto un errore più contenuto nella taratura, è necessario testare la coppia trasmissibile sull'impianto.

Il dispositivo viene consegnato tarato alla coppia riportata a catalogo  $T_{2M}$  salvo diversa indicazione espressa in fase di ordinazione.

### 2.10 Torque limiter with through hollow shaft

*The use of a torque limiter is advisable when the application requires the limitation of the transmissible torque to safeguard the plant and/or the gearbox from unexpected or undesired overloads.*

*The torque limiter is equipped with a through hollow shaft and a friction clutch. It is integrated in the gearbox, therefore space requirement is limited.*

*Designed to be working in oil bath, the device is reliable over time and is not subject to wear unless in case of operation with prolonged slipping (it occurs when the torque values are higher than the calibration values).*

*Calibration can be easily adjusted from outside by tightening of the self-locking ring nut, which causes the compression of the 4 Belleville washers arranged in series.*

*The device does not go together with:*

- the use of tapered roller bearings at output
- prolonged operation under slipping conditions

*The following table shows the values of  $M_{2S}$  slipping torques depending on the number of revolutions of the ring nut.*

*Calibration values feature a  $\pm 10\%$  tolerance and refer to static conditions.*

*Under dynamic conditions the values of the slipping torque will change according to the type of overload: the values are higher if the load increase is uniform; the values are lower if sudden load peaks occur.*

**NOTE:** *Slipping occurs when the setting values are exceeded.*

*The friction coefficient between the contact surfaces from static becomes dynamic and the transmitted torque is approx. 30% lower.*

*It is advisable to have a stop first in order to have a restart based on the initial setting value.*

*It is important to note that the slipping torque is not the same for the whole life of the torque limiter.*

*It usually decreases in connection with the numbers and the duration of the slipping which because of the surfaces' lap- ping will increase the efficiency.*

*For this reason it is advisable to check the calibration of the device at regular intervals, specially during the running-in period.*

*Should a smaller calibration error be required, it is necessary to test the transmissible torque on the plant.*

*The device is supplied already calibrated at the torque reported in the catalogue  $T_{2M}$ , unless otherwise specified in the order.*

### 2.10 Drehmomentenbegrenzer mit durchgehender Hohlwelle

Die Anwendung eines Drehmomentbegrenzers wird empfohlen, um die Anlage und/oder das Getriebe gegen ungewünschte und unerwartete Überbelastungen zu schützen.

Es handelt sich um eine Vorrichtung mit einer durchgehenden Hohlwelle.

Er ist in dem Getriebe integriert, d.h. der Raumbedarf ist klein. Der Begrenzer wurde für Betrieb in einem Ölbad entworfen.

Er ist zuverlässig und verschleißfrei (nur im Falle eines dauerhaften Rutschens entsteht Verschleiß, hier ist das Drehmoment größer als der eingestellte Eichwert).

Die Eichung kann mühelos von aussen durch das Anziehen einer selbstsperrenden Mutter ausgeführt werden, dadurch wird der Druck auf die 4 wechselseitig angeordneten Tellerfedern erhöht.

Die Vorrichtung sieht das folgende nicht vor:

- die Verwendung von Kegelrollenlager am Abtrieb
- Längerer Rutschbetrieb

Die nachstehende Tabelle zeigt die Werte der Rutschmomente  $M_{2S}$  abhängig von der Anzahl der Umdrehungen der Mutter.

Die Eichwerte weisen  $\pm 10\%$  Toleranz auf und beziehen sich auf statische Bedingungen.

Unter dynamischen Bedingungen hat das Rutschmoment verschiedene Werte je nach Art der Überbelastung. Die Werte sind höher, wenn die Belastung gleichmäßig zunimmt; sie sind niedriger im Falle von plötzlichen Belastungsspitzen.

**BEMERKUNG:** Rutschen tritt auf, wenn die eingestellten Werte überschritten werden. Der Reibungsfaktor zwischen den Berührungsflächen wird dynamisch anstatt statisch und das übertragene Drehmoment sinkt um ca. 30%.

Es ist daher ratsam, vor dem erneuten Anfahren anzuhalten, um die ursprünglichen Drehmomentwerte zu erreichen.

Es ist wichtig zu beachten, dass das Rutschmoment über die gesamte Lebensdauer der Rutschkupplung nicht konstant bleibt, sondern üblicherweise in Verbindung mit längeren Rutschzyklen aufgrund der eingelaufenen Berührungsflächen abnimmt.

Deswegen ist es ratsam, die Eichung der Vorrichtung besonders während der Einlaufzeit zu prüfen.

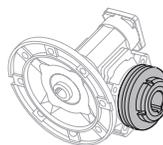

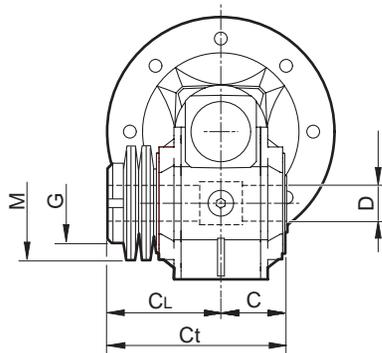

Falls ein niedrigerer Eichfehler gewünscht ist, sollte das übertragbare Drehmoment auf der Anlage getestet werden.

Wenn die Vorrichtung geliefert wird, ist sie schon auf das im Katalog  $T_{2M}$  angegebenen Drehmoment geeicht, ausser wenn es in der Bestellung anders angegebene wird.

### 4.1 Características

Los reductores de tornillo sin fin BFK - BRK se presentan formidablemente ligeros gracias a su forma compacta de la carcasa en aluminio fundido bajo presión. La serie presenta varias posibilidades de versiones, con y sin pié, que la hacen aún más adaptable en el uso de cada tipología de aplicación. Los tornillos sin fin son de acero aleado cementado - templado y son rectificadas. Los dientes de los engranajes realizados en hierro fundido y el anillo en bronce.

### 4.1 Characteristics

The BFK - BRK worm gearboxes are extremely light thanks to the compact shape of the housing made of cast aluminium. This series features a wide range of versions, with and without feet, with numerous accessories which make it extremely versatile for utilization in various applications. The worm shaft is ground and is made of hardened-casehardened compound steel. The worm wheel features a cast iron hub with bronze casting.

### 4.1 Caractéristiques

Les réducteurs à vis sans fin BFK - BRK sont extrêmement légers grâce à la forme compacte de leur carter, en fonte et en alliage d'aluminium. La série possède plusieurs versions possibles, avec et sans pattes, qui rendent son emploi universel pour chaque type d'application. La vis sans fin est en acier cémenté et trempé. Le profil est rectifié. Le moyeu de la roue est en fonte avec un insert en bronze.

## 4 BFK - BRK

### 4.3 Lubricación

Los reductores de tornillo sin fin BFK - BRK se entregan todos y siempre completos de lubricante sintético a base PAG con viscosidad ISO 320.

Los cuerpos de aluminio 30, 40, 50, 63, 75 tiene solamente un tapón de llenado para aceite.

### 4.3 Lubrication

BFK - BRK worm gearboxes are supplied with PAG synthetic lubricant featuring an ISO 320 viscosity class.

Aluminium housings size 30, 40, 50, 63 and 75 have one filling plug only.

### 4.3 Lubrification

Les réducteurs à roue et vis sans fin SFK - SRK sont livrés avec un lubrifiant synthétique à base PAG ayant un indice de viscosité ISO 320.

Les carters en aluminium 30, 40, 50, 63, 75 ont un seul bouchon de remplissage.

### 4.10 Limitador de par agujero pasante

El limitador de par se aconseja en todas las aplicaciones donde requieran una limitación en el par transmisible para la protección de la instalación y/o preservar el reductor de sobrecargas o golpes inesperados.

Es un dispositivo dotado de eje con agujero pasante, su funcionamiento en fricción, integrado en el reductor y ocupa un espacio limitado.

Realizados para trabajar en baño de aceite, el dispositivo resulta fiable en el tiempo y es exente a usar si no es mantenido en condiciones prolongadas de deslizamiento (condiciones que se verifican cuando el par tiene valores superiores a los del calibrado).

El calibrado es fácilmente regulable desde el externo, a través de la sujeción de una abrazadera autoblocante que comprime los cuatro resortes a taza dispuestos entre ellos en serie.

El dispositivo no permite:

- El uso de cojinetes de rodillos cónicos en salida
- funcionamiento prolongando en condiciones de deslizamiento.

En la siguiente tabla se detallan los valores de los pares de deslizamiento  $M_{2S}$  en función del n° de giros de la abrazadera.

Los valores para calibrar tienen tolerancia del  $\pm 10\%$  con referencia a la condición estática.

En condiciones dinámicas se note que el par de deslizamiento asume valores distintos según el tipo y/o modalidad en el cual se verifica la sobrecarga: con valores mayores en caso de cargas uniformemente creciente, con respecto a pesos menores, se debe a picos imprevistos de cargas.

**NOTA:** Cuando se superan los valores de calibre se obtiene el deslizamiento. El coeficiente de fricción entre la superficie de contacto del estático deviene dinámico y el par transmitido baja aproximadamente un 30%.

De hecho es oportuno anticipar un stop para así poder iniciar con los valores de base del calibrado.

Es importante notar que el par de deslizamiento no es siempre el mismo durante la vida del limitador.

De hecho tiende a disminuir en relación al número y a su durabilidad de los deslizamientos, que rodando las superficies de contacto, aumenta el rendimiento.

Entonces es aconsejable verificar periódicamente, sobretodo durante la fase de rodaje, el calibre del dispositivo.

Allí donde se exige un error mayor de contenido en la calibración, es necesario probar el par transmisible en la instalación.

El dispositivo se entrega calibrado al par referido en el catálogo como  $T_{2M}$  excepto distintas indicaciones que se expresan ordenadamente en fase.

### 4.10 Torque limiter with through hollow shaft

*The use of a torque limiter is advisable when the application requires the limitation of the transmissible torque to safeguard the plant and/or the gearbox from unexpected or undesired overloads.*

*The torque limiter is equipped with a through hollow shaft and a friction clutch. It is integrated in the gearbox, therefore space requirement is limited.*

*Designed to be working in oil bath, the device is reliable over time and is not subject to wear unless in case of operation with prolonged slipping (it occurs when the torque values are higher than the calibration values).*

*Calibration can be easily adjusted from outside by tightening of the self-locking ring nut, which causes the compression of the 4 Belleville washers arranged in series.*

*The device does not go together with:*

- *the use of tapered roller bearings at output*
- *prolonged operation under slipping conditions*

*The following table shows the values of  $M_{2S}$  slipping torques depending on the number of revolutions of the ring nut.*

*Calibration values feature a  $\pm 10\%$  tolerance and refer to static conditions.*

*Under dynamic conditions the values of the slipping torque will change according to the type of overload: the values are higher if the load increase is uniform; the values are lower if sudden load peaks occur.*

**NOTE:** *Slipping occurs when the setting values are exceeded.*

*The friction coefficient between the contact surfaces from static becomes dynamic and the transmitted torque is approx. 30% lower.*

*It is advisable to have a stop first in order to have a restart based on the initial setting value.*

*It is important to note that the slipping torque is not the same for the whole life of the torque limiter.*

*It usually decreases in connection with the numbers and the duration of the slipping which because of the surfaces' lapping will increase the efficiency.*

*For this reason it is advisable to check the calibration of the device at regular intervals, specially during the running-in period.*

*Should a smaller calibration error be required, it is necessary to test the transmissible torque on the plant.*

*The device is supplied already calibrated at the torque reported in the catalogue  $T_{2M}$ , unless otherwise specified in the order.*

### 4.10 Limiteur de couple creux continu

Le limiteur de couple est conseillé pour toutes les applications qui nécessitent une limitation sur le couple transmissible pour protéger la machine et/ou préserver le réducteur en évitant les surcharges ou les chocs.

Le limiteur fonctionne à friction et il est doté d'un arbre creux continu. Il est, de plus, intégré au réducteur, ce qui offre un encombrement limité.

Conçu pour fonctionner en bain d'huile, le dispositif est fiable sur la durée et il ne s'use pas, sauf en cas de glissement prolongé (condition qui se vérifie lorsque le couple présente des valeurs supérieures à celles du calibrage).

Le calibrage se fait facilement depuis l'extérieur en serrant une frette autobloquante qui comprime les 4 rondelles Belleville disposées en série.

Le dispositif ne permet pas :

- l'utilisation de roulements coniques à la sortie
- le fonctionnement prolongé en condition de glissement.

Dans le tableau ci-dessous sont reportées les valeurs des couples de glissement  $M_{2S}$  en fonction du nombre de tours de la frette.

Les valeurs de calibrage ont une tolérance de  $\pm 10\%$  et se réfèrent à une condition statique.

Il faut noter qu'en conditions dynamiques le couple de glissement a des valeurs différentes suivant le type et/ou les modalités de surcharge : les valeurs sont plus élevées si la charge augmente de manière continue, mais elles sont plus basses si l'on a une augmentation soudaine de la charge.

**REMARQUE :** il y a glissement lorsque la valeur de calibrage est dépassée. Le coefficient de frottement entre les surfaces passe de statique à dynamique et le couple transmis chute d'environ 30%. Il est donc recommandé de s'arrêter afin de pouvoir repartir sur la base du calibrage initial.

Il est important de remarquer que le couple de glissement change au fur et à mesure de l'utilisation du limiteur.

Il a en effet tendance à diminuer par rapport au nombre et à la durée des glissements qui, en rodant les surfaces de contact, en augmentent le rendement.

Il est donc conseillé de régulièrement vérifier, surtout pendant la phase de rodage, le calibrage du dispositif.

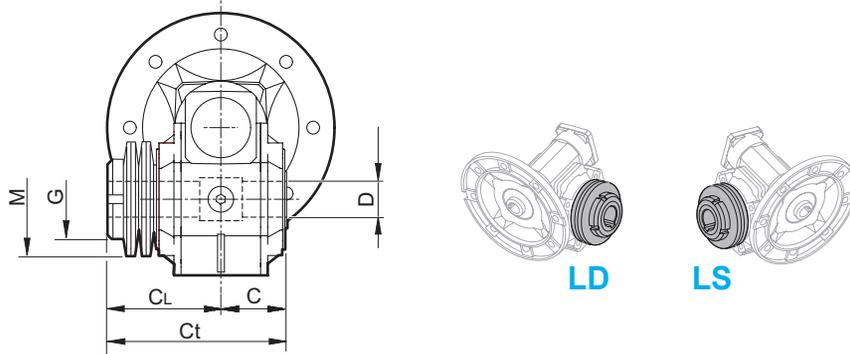

Si une erreur minime est réclamée pour le calibrage, il est nécessaire de tester le couple transmissible sur la machine.

Le dispositif est livré calibré sur le couple reporté  $T_{2M}$  dans le catalogue, sauf suite à une demande spécifique faite au moment de la commande.

( ) A petición / On request / Sur demande

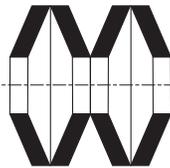

La versión con limitador no se incluyen los ejes lentos.  
El dispositivo se entrega calibrado al par referido en el catálogo como T<sub>2M</sub> excepto distintas indicaciones que se expresan ordenadamente en fase.

*The version with torque limiter is supplied without output shafts.  
The device is supplied already calibrated at the torque reported in the catalogue T<sub>2M</sub>, unless otherwise specified in the order.*

Les arbres lents ne sont pas fournis dans la version avec limiteur.  
Le dispositif est livré calibré sur le couple reporté T<sub>2M</sub> dans le catalogue, sauf suite à une demande spécifique faite au moment de la commande.
